

I decided to create three images with generative AI and the results were pretty cool. First, I asked for a sloth driving a Corvette and it gave me just what I wanted - even with an accurate Corvette model. Second, I asked if the AI could make me an image of a couch potato and it made a man on the couch eating chips with a TV remote in his hand. I figured it would do this, but I wanted an actual potato so I asked for that change to be made. It was made and it turned out better than I expected. Finally, I asked for a man with a TV for a head and got that. All the images were very close to what I would've expected from the AI, but I still was surprised at how well the images turned out.

I used the ChatGPT built into my browser (Opera GX) called Aria. I chose to use this since it is very easy to get to and use as it is already set up on a sidebar within the browser I already use for classwork. Everything worked smoothly and how I would expect it to work.
